RENEWABLE ENERGY AUCTIONS IN KAZAKHSTAN 2018-2022 RESULTS

**Astana, Kazakhstan
2023**

INTRODUCTION

The Report on Renewable Energy Auctions in Kazakhstan, Results for 2018–2022 provides brief information about the development of renewable energy (RE) in Kazakhstan. In addition, the Report reviews the government’s strategic goals, policies, and regulations in the field of RE, as well as statistical information and results of RE auctions conducted in 2018 - 2022. This Report includes the following chapters:

1. Goals of RE Development in Kazakhstan
2. Current RE Development Statistics
3. State Regulation of RE Development
4. RE Auction Mechanism
5. 2018 Auction Results
6. 2019 Auction Results
7. The First Project-Specific Auction - 50 MW SPP in Shoulder Village, Turkestan region
8. 2020 Auction Results
9. 2021 Auction Results
10. 2022 Auction Results
11. Conclusion
12. Annexes

This Report was prepared jointly by the Kazakhstan Electricity and Power Market Operator JSC (KOREM JSC) and the U.S. Agency for International Development’s (USAID) Power Central Asia Activity, implemented by Tetra Tech. Inc.¹

¹ This report is not an official, legal, or other special consultation document and it is offered solely for information purposes. USAID is not liable for any actions taken relying on information contained in this report. RENEWABLE ENERGY DEVELOPMENT GOALS IN KAZAKHSTAN

Kazakhstan has significant reserves of energy resources, such as oil, gas, coal, and uranium. In Kazakhstan, electricity is produced primarily from coal, gas, hydro resources and, to a lesser extent, from renewable energy (RE) (Figure 1).

Figure 1. Electricity generation in Kazakhstan (2022) according to the Ministry of Energy of the Republic of Kazakhstan.

At the same time, Kazakhstan has great RE potential. The most significant potential is from wind power – wind speeds of 4-5 meters per second (m/s) at an elevation of 30 meters (m) is typical for approximately 50 percent of the territory of Kazakhstan. The country also has great solar power potential – the number of solar hours is 2,200-3,000 per year.

In May 2013, following the international trends for low-carbon development, Kazakhstan adopted the Concept for the country-wide transition to a “Green Economy” and approved the following ambitious goal: by 2050, 50 percent of electricity should be generated from alternative and renewable energy sources. According to the *Concept for Transition of the Republic of Kazakhstan to Green Economy* and the 2025 Strategic Development Plan for the Republic of Kazakhstan, the share of RE in total electricity generation should have reached 3 percent by 2020, 6 percent by 2025, 15 percent by 2030 and 50 percent (alternative and RE) by 2050 (Figure 2).

*alternative and renewable energy sources

Figure 2. RE Development targets in Kazakhstan established in 2013.

CURRENT RENEWABLE ENERGY DEVELOPMENT STATISTICS

Since the introduction of a feed-in tariff for RE in 2014 and over the past eight years, the number of RE projects has grown significantly. As of December 2022, 130 RE facilities were operating in Kazakhstan with a total installed capacity of 2388 megawatts (MW), including: 46 WPP – 958 MW; 44 SPP – 1,148 MW; small 37 HPP – 280 MW; 3 BioPP – 1.77 MW (Figure 3, 6).

By 2025, the total installed RE capacity is projected to be no less than 3,000 MW. As of December 2022, power purchase agreements (PPAs) for 3300 MW have already been signed with an off-taker (the Financial Settlement Center [FSC]), including 10 PPAs for a total installed capacity of 440 MW selected as a result of 2022 auctions.

Figure 3. RE development statistics in Kazakhstan².

Current Major RE projects

- First WPP - 45 MW
- Astana EXPO-2017 WPP - 100 MW
- ArmWind WPP - 48 MW
- Korday WPP – 21 MW
- Zhanatas WPP – 100 MW
- Redkometalnaya – 43.6 MW
- Burnoye Solar SPP - 100 MW
- Saran SPP - 100 MW
- Agadyr SPP – 50 MW
- Gulshat SPP – 40 MW
- Kabanbay-Batyr SPP – 100 MW
- Kaskelen SPP – 50 MW
- Nurgisa SPP - 100 MW³

² Statistical data is provided by the Ministry of Energy (MoE) of Kazakhstan.

³ An interactive map of RE projects in Kazakhstan is available via the FSC website at <https://rfc.kz/en/vie/yamaps/index>

Figure 6. RE development from 2015 to 2022.

NATIONAL REGULATIONS SUPPORTING RE DEVELOPMENT

To achieve the established goals and to stimulate investments in clean energy, Kazakhstan is focused on improving its regulatory framework. The first law in Kazakhstan that intended to support RE development was adopted in 2009, and since then the institutional and legal frameworks for RE development have significantly improved.

In December 2020, the *Law on Amendments and Additions to Certain Legislative Acts of the Republic of Kazakhstan on Supporting the Use of Renewable Energy Sources and Electricity* was adopted. The following amendments were introduced by this Law:

- hydroelectric power plants are obliged to sell electricity generated from flood water to FSC, which in turn will distribute this inexpensive electricity among all consumers of the Republic of Kazakhstan, through the existing mechanism of centralized sale of RE electricity;
- encourage the construction of power plants, which have a flexible generation mode;
- introduce a “pass-through tariff” for the support of RE, which will be added on top of the ceiling tariff for electricity generated by conventional energy producers;
- establish the potential for the government to grant the FSC financial assistance in case the FSC fails to fulfill payment obligations to RE project developers;
- extension of the PPA term from 15 to 20 years;
- introduce an auction mechanism to select waste to energy projects.

To date, the regulatory framework for RE investments includes the following key elements:

Single buyer of electricity produced by RE facilities	In 2013, the FSC was established under JSC "Kazakhstan Electricity Grid Operating Company" (KEGOC), which carries out a centralized purchase and sale of electricity produced by renewable energy facilities and supplied to electric networks. In 2022, the FSC was transferred under the control of the Ministry of Energy of the Republic of Kazakhstan. The FSC carries out the financial settlement of imbalances from RE facilities. Conditional consumers ⁴ are obliged to purchase from the FSC the entire amount of electricity produced by RE facilities.
Tariffs	From 2014 to 2017 and before the introduction of the auction mechanism, a feed-in tariff in local currency was applied to electricity produced from RE. The auction mechanism was introduced in 2017. The current prices for RE projects were set through the 2018-2022 auctions.
Tariff indexation	Feed-in tariffs are subject to annual indexation: 70 percent for consumer price index (CPI) and 30 percent for foreign currency exchange rate. Auction rates

⁴ According to the *Law on Support for the Use of Renewable Energy Sources*, the conditional consumers of electricity produced from RE include: a. energy producing companies that use coal, gas, raw materials containing sulfur, oil products and nuclear fuel; b. companies that acquire electric energy outside of Kazakhstan; and c. hydroelectric power plants with installations located within one hydro system, with a total capacity of more than 35 MW (with the exception of those commissioned after January 1, 2016).

are also subject to annual indexation. According to the amendments and additions to the Decree of the Government of the Republic of Kazakhstan, dated March 27, 2014, No. 271 “On Approval of the Rules for Determining Fixed Tariffs and Maximum Auction Prices,” the new amendments in 2022 provide for:

- one-time indexation of auction prices for the period of construction by 100 percent of the change in the exchange rate of the national currency against the U.S. dollar;
- annual indexation of auction prices with the choice of indexation formula once at the conclusion of the purchase agreement for the entire period of its validity;
- annual indexation of auction prices for 100 percent change in the exchange rate of the national currency against the U.S. dollar.

PPA term

The PPA term is 15 years from the start date of a renewable power plant’s installation testing, and the seller of electricity generated from a RE facility should provide a financial guarantee for the fulfillment of PPA provisions at the rate of 10,000 KZT/kilowatt (kW) of installed capacity. In addition to other terms and conditions, the PPA grants creditors the right of direct project management (step-in rights).

For auctions held after January 1, 2021, the PPA term is 20 years from the start date of a comprehensive test of a RE power plant or from the date of expiration of the term for submission of the act of acceptance of the object into operation in accordance with the contract of sale, whichever comes first.

PPA provides for the following timeframe for putting the RE facility into operation: for SPP - 24, WPP and BioPP - 36, and HPP - 60 months. However, it is possible to extend the construction period by 1 year if the RE facility is at least 70 percent ready by the time of the set commissioning date.

Construction period

The PPA allows the following periods for RE facility commissioning: SPP – 24 months, WPP and BioPP – 36 months, and HPP – 60 months. However, the construction period may be extended for one year if the readiness of a RE facility is not less than 70 percent by the specified date of commissioning.

To implement the instruction of the meeting of the State Commission on ensuring the emergency regime from April 17, 2020, by order of the MoE No. 197 from May 19, 2020, all energy-producing organizations that use RE and have valid PPA agreements with the FSC were given the opportunity to extend the deadlines of providing a copy of the notification on the beginning of construction and installation works and (or) a copy of the act of commissioning of a RE facility for a period not exceeding one calendar year. This Order was entered into force on May 26, 2020, and was valid until November 1, 2020.

Dispute resolution

Disputes shall be resolved by the court at the location of the buyer (FSC). However, the PPA also grants the right to resolve disputes in the Astana

International Financial Center's (AIFC) international arbitration center. AIFC allow the use of the IAC rules, United National Commission on International Trade (UNCITRAL) Model Rules or ad hoc rules as arbitration regulations.

Grid connection	Access to the electric grid, priority dispatch and obligatory wheeling of electricity from RE facilities are guaranteed. The transmission system operator (TSO) may not refuse to connect RE facilities once the technical readiness of the electrical grid is confirmed.
Electricity transmission	RE producers are exempt from payment for electricity transmission services and the obligation to obtain electricity generation licenses.
RE Auction	An online and unilateral auction mechanism was introduced in 2017. Land plots and grid connection points are reserved for auctions and the main criterion for the selection of auction winners is the lowest price. As previously mentioned, a 15-year PPA is awarded to RE auction winners for while auctions held after January 1, 2021, will award bid winners with 20-year PPAs.
Investment preferences	The Commercial Code of Kazakhstan provides investment preferences such as exemption from tax duties and value added tax (VAT) on imported equipment, as well as state land grants, subject to fulfillment of certain conditions.

Kazakhstan's legislative framework creates the following support mechanisms to develop RE projects:

- introduce a new auction type that includes site-specific documentation (project auctions);
- improve the auction procedure and its qualification requirements.

At the same time, the government continues to introduce and reform current legislation in order to attract investment in RE and plans to consider the following issues:

- integrate RE into the Unified Electric Power System (UES) of Kazakhstan;

- construct additional flexible generation capacities (large HPPs and gas power plants);
- long-term planning and improve the RE auctions;
- improve the mechanism of distributed renewable energy generation among the population and SMEs;
- provide incentive mechanisms to construct large HPPs;
- develop renewable energy with energy storage solutions;
- analyze the feasibility of reaching 2050 RE target, considering construction of a nuclear power plant and other alternative energy sources.

RENEWABLE ENERGY AUCTIONS MECHANISM

RE auctions have become increasingly popular as a global best practice mechanism to procure energy at least-cost competitive prices. According to the International Renewable Energy Agency (IRENA), in 2017-2018 some 55 countries used auctions to procure renewables-based electricity and, by the end of 2018, 106 countries used auctions for these purposes.⁵

As a result of RE auctions, price results for solar and wind auctions have significantly decreased in the past decade. Below, Figure 7 illustrates the global average price results for solar photovoltaic (PV) and onshore wind auctions held between January 2010 and December 2018⁶.

According to this figure, in 2010 solar energy was contracted at a global average price of almost \$250/MWh, compared with the global average price of \$83/MWh in 2016. The global average prices for solar PV also decreased sharply between 2010 and 2017. The steep decrease was driven mainly by a steady decline in the price of solar panels, which fell to a quarter of their initial price over the same period.

During the same period, wind prices also fell, albeit at a slower pace. The average price in 2016 was \$50/MWh, down from \$75/MWh in 2010.

The decrease in prices continued until 2017, followed by an increase in 2017-2018. The increase is mainly due to high-price countries that constituted a larger share of the wind volume auctioned globally.

In addition to the decline in prices for RE technologies, the following factors influenced the decline in world auction prices:

- country specific conditions such as resource availability, electricity market structure, cost of capital, land and labor;
- the degree of investor confidence is related to, for example, the experience of the bidder and auctioneer, and credibility of the off-taker;
- other policies related to RE including clear targets, grid policies, priority dispatch, and local content rules and the auction design.

Figure 7. Global weighted average prices resulting from 2010-2018 auctions and annual awarded capacities.

⁵Information accessed via <https://www.irena.org/publications/2019/Dec/Renewable-energy-auctions-Status-and-trends-beyond-price>.

⁶ The calculated global weighted averages are obtained by averaging the auction outcomes from countries with different macroeconomic dynamics, energy policy and auction design among many other factors.

In Kazakhstan, the auction mechanism was introduced at the end of 2017 instead of a feed-in tariff to select the most effective projects and determine competitive market prices for electricity produced by RE facilities. The *RE Auction Rules* were developed based on global best practices and international experiences and include the qualification requirements for auction participants, the bidding and application submission procedure, types of financial guarantees and terms for the provision and repayment thereof, and procedures for confirming the results and determining the auction winners, among others.

KOREM JSC provides an electronic trading platform and acts as the auction organizer. The MoE approves the annual Auction Schedule, which includes the following: information on the proposed land plots and grid connection points; the amount of installed capacity (MW) to be auctioned; type of RE technology; starting auction ceiling price (KZT/kWh); project size (small, large), auction type; RE facility location within the UES RK; and auction date and time.

Key Characteristics of the Auction Mechanism in Kazakhstan

Auction schedule – auctions are held according to a schedule, and sessions are held separately for certain RE types and regions (north, west and south) considering the technical connection limitations. RE auctions are classified in terms of installed capacity: small is up to and including 10 MW and large is over 10 MW.

Auction format – a unilateral auction is conducted online via an electronic trading system, and the main criteria used to determine auction winners is the lowest bid price. Auction starting ceiling prices are established by the MoE. For the 2018 auctions, the auction ceiling prices were set at the level of the feed-in tariff for each RE type. For the 2019 and 2020 auctions, the auction ceiling prices were set at the maximum auction price by RE type, proposed at the 2018

and 2019 auctions respectively.

Auction type – auctions with and without project documentation. Auctions with project documentation were introduced in 2019. When using this auction type, potential investors are provided in advance with project detailed information and technical data (such as land plots, resource potential, preliminary feasibility study, power distribution scheme, specifications, environmental impact assessment, etc.). More detailed information and calculations allows investors to offer a lower auction price.

Primary pre-qualification criterion – for an auction trading session, pre-qualification is the provision of a financial guarantee at the rate of 2,000 KZT/kW of installed capacity for auctions without project documentation, and 5,000 KZT/kW of installed capacity for auctions with project documentation. The financial guarantee should be provided in the form of a bank guarantee or a standby letter of credit issued to the FSC in the SWIFT system.

Criteria to recognize auctions as valid – (a) participation of at least two bidders; and (b) the total volume of applications should be more than 130 percent of the announced capacity.⁷ Paragraph (b) is not applicable for auctions of BioPP and HPP projects.

Auction results – the winners and the FSC sign a PPA with a validity period of 20 years. When signing a contract, the winner should provide the FSC with a PPA performance bond at the rate of 10,000 KZT/kW of RE project installed capacity. The auction winners with signed PPA are obliged to use only new generating equipment for the construction of RE facilities.

⁷ The first auctions were held in spring 2018. These were recognized as valid subject to the participation of at least three bidders and a total volume of bids for not less than 150 percent of the installed capacity. Under these criteria, two of the 10 auctions were void. During the subsequent auctions held in autumn, these

requirements were relaxed to two bidders and 130 percent of the installed capacity. The terms and conditions for BioPP and HPP projects were also relaxed.

AUCTION RESULTS FOR 2018

In February 2018, the MoE announced the first auctions for the selection of RE projects and published the Auction Schedule for 2018. According to the Schedule, the total installed capacity declared for the auction amounted to 1,000 MW with a breakdown by the following power plant type: WPP – 620 MW; SPP – 290 MW; HPP – 75 MW; and BioPP - 15 MW.

In 2018, the starting auction ceiling prices were established at the level of the following feed-in tariffs:

- WPP – 22.68 KZT/kWh (6.58 US cents/kWh)⁸;
- SPP – 34.61 KZT/kWh (10.04 US cents/kWh);
- HPP – 16.71 KZT/kWh (4.85 US cents/kWh);
- BioPP – 32.23 KZT/kWh (9.35 US cents/kWh).

A total of 20 auctions were planned (11 for small and 9 for large RE projects), of which seven auctions were recognized as void due to an insufficient number of bidders or an insufficient number of applications.

Overall, during the 2018 auctions, 36 RE projects with total installed capacity of 857.93 MW were selected, including: WPP – 500.85 MW, SPP – 270 MW, small HPP – 82.08 MW and BioPP – 5 MW (Figure 8).

Figure 8. Total installed capacity of RE projects selected through 2018 auctions.

The auction participants included 113 local and international companies from nine countries: Kazakhstan, Russia, China, Turkey, France, Bulgaria, the United Arab Emirates (UAE), Italy and the Netherlands.

The bids for a total capacity of 3,422 MW were received, indicating that the total bid capacity was 3.4 times greater than the amount offered by the auction. Eighty five percent of the proposed capacity was cleared at the auctions, and bidders were interested in projects of all proposed RE types.

In particular, the total bid capacity for BioPP, HPP and WPP projects was approximately twice as great as the amount offered by the auction. However, investors showed the greatest interest in SPP projects, and the total bid capacity was seven times higher than the amount offered by the auction.

According to the auction results, the largest auction price decreases were: WPP projects - 23.3 percent, SPP – 48 percent, small HPP – 23.4 percent, and BioPP – 0.25 percent (Figure 9). These results confirm that auctions reduce energy prices and make it possible to determine market-based prices for electricity produced by RE facilities. More detailed 2018 auction results are provided in Table I below. The list of 2018 auction winners are provided in Annex I.

⁸ The average value of the official exchange rate of the National Bank of the Republic of Kazakhstan for 2018 was used - 344.71 KZT/USD.

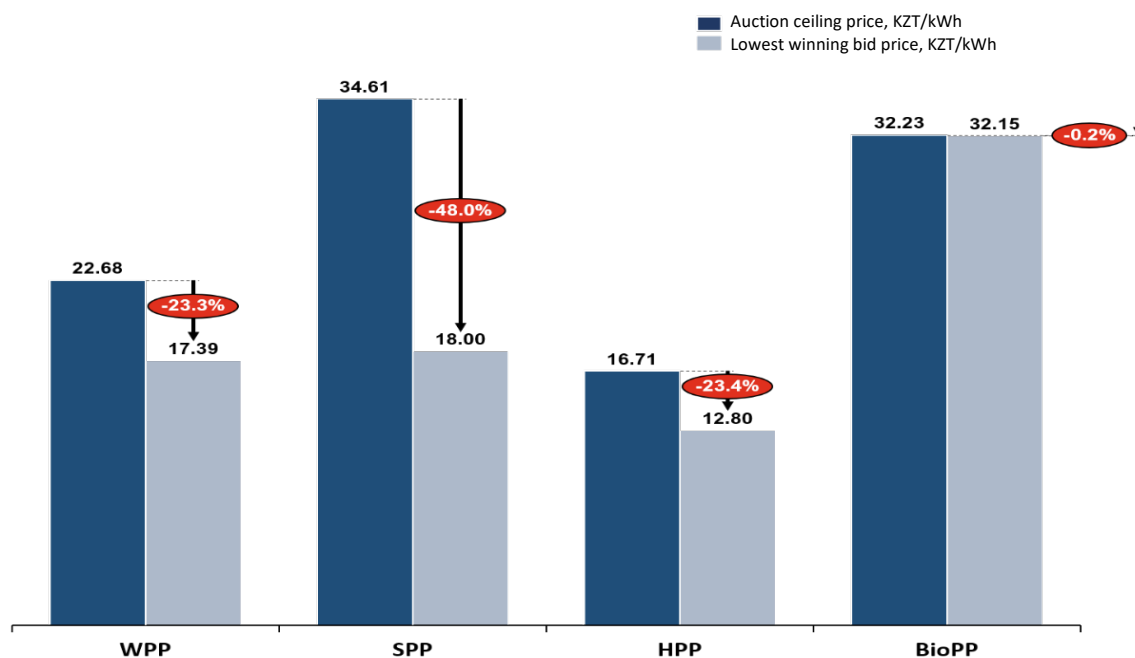

Figure 9. Price decreases due to 2018 auctions.

TABLE I. RESULTS OF 2018 RE AUCTIONS						
RE technology	Auctions capacity (MW)	Capacity proposed by bidders (MW)	Capacity successfully auctioned (MW)	Number of projects selected	Starting auction ceiling price (KZT/kWh) / (US cents/ kWh)*	Minimum auction price (KZT/ kWh) / (US cents/ kWh)
Wind	620	1235.85	500.85	16	22.68 / 6.58	17.39 / 5.04
Solar	290	2023.10	270	12	34.61 / 10.04	18 / 5.22
HPP	75	152.50	82.08	7	16.71 / 4.85	12.80 / 3.71
Biogas	15	10.90	5	1	32.23 / 9.35	32.15 / 9.33
Total:	1 000	3 422.35	857.93	36	-	-

*Average currency exchange rate for 2018 – 344.71 KZT/USD

AUCTION RESULTS FOR 2019

According to the 2019 Auction Schedule approved by the MoE, RE auctions were announced for a total of 255 MW installed capacity with the following types of RE power plants: WPP – 100 MW; SPP – 80 MW; HPP – 65 MW; and BioPP – 10 MW.

A total of eight auctions were planned and held (four for small and four for large RE projects), including seven auctions without and one auction with project documentation⁹. According to the Rules for determination of feed-in tariffs and auction ceiling prices, the auction ceiling prices for the 2019 auction were determined based on the maximum price proposed by auction participants in 2018. Thus, the starting auction ceiling prices for 2019 auctions were set at the following levels (excluding VAT):

- WPP – 22.66 KZT/kWh (5.92 US cents/kWh)¹⁰;
- SPP – 29 KZT/kWh (7.58 US cents/kWh);
- HPP – 15.48 KZT/kWh (4.04 US cents/kWh);
- BioPP – 32.15 KZT/kWh (8.4 US cents/kWh).

During the 2019 auctions, 13 RE projects were selected with a total installed capacity of 212.89 MW, including: WPP – 108.99 MW, SPP – 86.5 MW, HPP – 7 MW and BioPP – 10.4 MW (Figure 10).

The auction participants included 32 local and international companies from eight countries: Kazakhstan, Russia, China, Germany, Malaysia, Italy, Spain and the Netherlands.

Figure 10. Total installed capacity of RE projects selected during 2019 auctions.

The bids for total capacity of 818.99 MW were received, meaning the total amount of bid capacity was 3.2 times greater than the amount offered by the auction.

A total of 83 percent of the proposed capacity was cleared at the auctions and auction winners had an interest in projects of all proposed RE types. Total amount of the bid capacity for WPP was 2.8 times greater than the amount offered by the auction. However, investors were most interested in SPP, and the total amount of the bid capacity was 6.5 times higher than the amount offered by the auction. Through the auctions, the largest price reduction was 15 percent under WPP, 66 percent under SPP, 0.3 percent under HPP and 0.1 percent under BioPP (Figure 11). Table 2, below, provides auction results for 2019. The list of auction winners in 2019 is provided in Annex 2.

⁹ In 2019, the Auction Rules were amended and classification of auctions with and without project documentation was introduced. When holding site-specific auctions with project documentation, potential investors are provided with a package of documents that describe the basic project parameters. This documentation includes marketing research for the construction of new RE facilities, including the resource potential assessment, results of public hearings and preliminary environment impact assessment, land plot

location considering specifications and costs for purchase/lease of land plots, power distribution schemes and grid connection specifications.

¹⁰ The average value of the official exchange rate of the National Bank of the Republic of Kazakhstan for 2019 was used – 382.75 KZT/USD.

Figure 11. Price decreases due to 2019 auctions.

TABLE 2. RESULTS OF 2019 RE AUCTIONS						
RE technology	Auction capacity (MW)	Capacity proposed by bidders (MW)	Capacity successfully auctioned (MW)	Number of projects selected	Starting auction ceiling price (KZT/kWh) / (US cents/ kWh)	Minimum auction price (KZT/kWh) / (US cents/ kWh)
Wind	100	278.99	108.99	5	22.66 / 5.92	19.27 / 5.03
Solar	80	522.6	86.5	3	29 / 7.58	12.49 / 3.26

FIRST PROJECT-SPECIFIC AUCTION FOR A 50 MW SPP IN SHAULDER VILLAGE, TURKESTAN REGION

As noted above, in 2019, the Auction Rules were amended and a new auction type – project-specific auction (with project documentation) was introduced. The project-specific auction type provides potential investors in advance with detailed information on project parameters, including marketing research for the construction of a new RE facility, an assessment of resource potential, grid connection specifications, etc. According to international experience, these types of auctions allow investors to propose lower electricity prices.

In 2019, as part of the UNDP/GEF Project “Derisking Renewable Energy Investments,” a documentation package was prepared for the 50 MW SPP auction, including an assessment of the resource potential, land plot location, considering specifications and costs for purchase/lease of land plots, results of public hearings and preliminary environment impact

assessment, power distribution schemes and grid connection specifications and other documents.

For this auction type, more stringent requirements were imposed. For instance, the amount of financial guarantee was increased from 2,000 to 5000 KZT per 1 kW of installed project capacity. To participate in this auction, 14 companies initially registered in KOREM’s trading system. However, only seven companies were admitted to the auction, as others failed to provide the financial guarantee for the auction bid. The auction was held on November 27, 2019. Seven companies from the following six countries participated in the auction: Kazakhstan, Italy, Russia, Germany, China and the Netherlands. During the trading session, bidders submitted 95 price quotations, with a starting auction price of 29 KZT/kWh and a final price of 12.49 KZT/kWh, which was 2.3 times lower.

TABLE 3. RESULTS OF PROJECT-SPECIFIC AUCTION IN SHAULDER VILLAGE

RE technology	Auction capacity (MW)	Capacity proposed by bidders (MW)	Capacity successfully auctioned (MW)	Number of submitted bidding prices	Starting auction price (KZT/kWh) / (US cents/ kWh)	Minimum auction price (KZT/kWh) / (US cents/ kWh)
Solar	50	350	50	95	29 / 7.58	12.49 / 3.26

*Average currency exchange rate for 2019 – 382.75 KZT/USD

The purpose of introducing the project-specific auctions was to offer investors more prepared and well-developed RE projects to reduce the risks to investors during construction, and to determine a lower competitive price for RE.

Despite the higher financial guarantee required to participate in the auction, this auction type saw great interest from international investors and allowed KOREM to exclude companies lacking the financial ability to implement the project.

AUCTION RESULTS FOR 2020

According to the Schedule approved by the MoE for 2020, RE auctions were announced for a total of 250 MW of installed capacity with the following types of power plants: WPP – 65 MW; SPP – 55 MW, of which two 20 MW each project-specific auctions; HPP – 120 MW; and BioPP – 10 MW.

According to the Rules to determine feed-in tariffs and auction ceiling prices, the ceiling prices for the 2020 auction were determined based on the maximum price proposed by auction participants in 2019. Thus, the starting auction ceiling prices for 2020 auctions were set at the following levels (excluding VAT):

- WPP – 21.69 KZT/kWh (5.25 US cents/kWh)¹¹;
- SPP – 16.97 KZT/kWh (4.11 US cents/kWh);
- HPP – 15.48 KZT/kWh (3.75 US cents/kWh);
- BioPP – 32.15 KZT/kWh (7.79 US cents/kWh).

A total of eight auctions were planned and held: four auctions for small projects without documentation, two for large projects without documentation, and two for large projects with documentation.

The auction participants included 27 local and international companies from the following four countries: Kazakhstan, Russia, Germany and the Netherlands.

Bids for a total capacity of 493.9 MW were received, indicating that the total amount of the bid capacity was two times greater than the amount offered by the auction. In particular, the total amount of capacity bid for WPP, SPP and small HPP was almost two times greater than the amount offered by the auction.

However, investors were most interested in WPP as the total amount of the capacity bid was five times higher than the amount offered by the auction.

Overall, during the 2020 auctions, 16 RE projects were selected with a total installed capacity of 147.95 MW, including: WPP – 64.95 MW, SPP – 60 MW, and HPP – 23 MW (Figure 14).

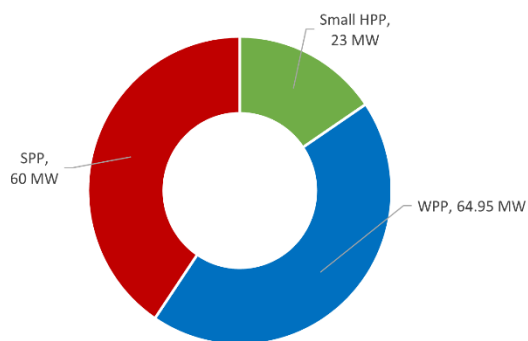

Figure 14. Total installed capacity of RE projects selected through 2020 auctions.

The auction winners selected 60 percent of the proposed auction capacity. The auctions were held in a regular mode, while two auctions were declared invalid due to the insufficient number of participants (large HPP and BioPPs). Through the auctions, the largest price reduction was 26.7 percent under WPP, 14.1 percent under SPP, 12.9 percent under HPP. Since the auction for BioPP projects did not take place, the auction price did not decrease (Figure 15). Table 4, below, provides the auction results for 2020, and the list of auction winners in 2020 is provided in Annex 3.

¹¹ The average value of the official exchange rate of the National Bank of the Republic of Kazakhstan for 2020 was used – 412.95 KZT/USD.

Figure 15. Price decreases due to 2020 auctions.

TABLE 4. RESULTS OF 2020 RE AUCTIONS						
RE technology	Auction capacity (MW)	Capacity proposed by bidders (MW)	Capacity successfully auctioned (MW)	Number of projects selected	Starting auction ceiling price (KZT/kWh) / (US cents/ kWh)	Minimum auction price (KZT/kWh) / (US cents/ kWh)
Wind	65	329.8	64.95	3	21.69/5.25	15.9/3.85
Solar	55	136.15	60	4	16.97/4.11	14.58/3.53

AUCTION RESULTS FOR 2021

According to the Schedule approved by the MoE for 2021, RE auctions were announced for a total of 200 MW of installed capacity with the following types of power plants: WPP – 50 MW; SPP – 20 MW, HPP – 120 MW; and BioPP – 10 MW.

The starting auction ceiling prices for 2021 auctions were set at the following levels (excluding VAT):

- WPP – 21.53 KZT/kWh (5.05 US cents/kWh)¹²;
- SPP – 16.96 KZT/kWh (3.98 US cents/kWh);
- HPP – 15.2 KZT/kWh (3.57 US cents/kWh);
- BioPP – 32.15 KZT/kWh (7.55 US cents/kWh).

A total of five auctions were planned and held: two auctions for small projects, three for large projects. The auctions were held in a regular mode, while one auction was declared invalid due to an insufficient number of bidders (large HPP).

The auction participants included 24 local companies. Bids for a total capacity of 626.95 MW were received, indicating the total amount of the capacity bid was three times greater than the amount offered by the auction. In particular, the total amount of the capacity bid for SPP and small HPP was almost three times greater than the amount offered by the auction. However, investors were most interested in WPP as the total amount of the capacity bid was ten times

higher than the amount offered by the auction (Table 5).

Overall, during the 2021 auctions, eight RE projects were selected with a total installed capacity of 86.95 MW, including: WPP – 50 MW, SPP – 20 MW, HPP – 11.8 MW and BioPP – 5.15 MW (Figure 16). The auction winners selected 43.48 percent of the proposed auction capacity.

Figure 16. Total installed capacity of RE projects selected through 2021 auctions.

Through the auctions, the largest price reduction was 34.6 percent under WPP, 24.11 percent under SPP, 1.31 percent under HPP. This is a good result, confirming that auctions provide price reductions and allow determining market prices for electricity from renewable energy facilities (Figure 17).

Table 5 below provides auction results for 2021, and the list of auction winners in 2021 is provided in Annex 4.

¹² The average value of the official exchange rate of the National Bank of the Republic of Kazakhstan for 2021 was used – 426.03 KZT/USD.

Figure 17. Price decreases due to 2021 auctions.

TABLE 5. RESULTS OF 2021 RE AUCTIONS						
RE technology	Auction capacity (MW)	Capacity proposed by bidders (MW)	Capacity successfully auctioned (MW)	Number of projects selected	Starting auction ceiling price (KZT/kWh) / (US cents/ kWh)	Minimum auction price (KZT/kWh) / (US cents/ kWh)

Total:	200	626.95	86.95	8	-	-

*Average currency exchange rate for 2021 – 426.03 KZT/USD

AUCTION RESULTS FOR 2022

According to the Schedule approved by the MoE for 2022, RE auctions were announced for a total of 690 MW of installed capacity with the following types of power plants: WPP – 400 MW; SPP – 60 MW, HPP – 220 MW; and BioPP – 10 MW.

The starting auction ceiling prices for 2022 auctions were set at the following levels (excluding VAT):

- WPP – 21.53 KZT/kWh (4.68 US cents/kWh)¹³;
- SPP – 16.96 KZT/kWh (3.68 US cents/kWh);
- HPP – 15.2 KZT/kWh (3.30 US cents/kWh);
- BioPP – 32.15 KZT/kWh (6.98 US cents/kWh).

A total of 13 auctions were conducted, including: two auctions for small projects, 11 for large projects. The auctions were held in a regular mode, while four auctions were declared invalid due to an insufficient number of bidders (large and small HPP, BioPP, and SPP).

The auction participants included 36 local companies from five countries, including: Kazakhstan, Russia, China, Singapore, Netherlands. Bids for a total capacity of 2,809 MW were received, indicating the total amount of capacity bid was four times greater than the amount offered by the auction. Investors were most interested in WPP as the total bid capacity was nearly seven times higher than the amount offered by the auction (Table 6).

Figure 18. Total installed capacity of RE projects selected through 2022 auctions.

Overall, during the 2022 auctions, ten RE projects were selected with a total installed capacity of 440 MW, including: WPP – 400 MW, and SPP – 40 MW. (Figure 19). The auction winners selected 63.77 percent of the proposed auction capacity.

Through the auctions, the largest price reduction was 42.5 percent under WPP. (Figure 19).

Table 6 below provides the auction results for 2022, and the list of auction winners in 2022 is provided in Annex 5.

¹³ The average value of the official exchange rate of the National Bank of the Republic of Kazakhstan for 2022 was used – 460.48 KZT/USD.

Figure 19. Price decreases due to 2022 auctions.

TABLE 6. RESULTS OF 2022 RE AUCTIONS						
RE technology	Auction capacity (MW)	Capacity proposed by bidders (MW)	Capacity successfully auctioned (MW)	Number of projects selected	Starting auction ceiling price (KZT/kWh) / (US cents/ kWh)	Minimum auction price (KZT/kWh) / (US cents/ kWh)

CONCLUSION

The first RE auctions were held in Kazakhstan in 2018. From 2018 to 2022, 54 RE auctions have been held for a total installed capacity of 2,395 MW. Of these auctions, 1,745.72 MW of installed capacity was selected with the following breakdown by RE type: WPP – 1 124.79 MW; SPP – 476.5 MW; HPP – 123.88 MW; and BioPP – 20.55 MW.

The auction participants included a total of 232 companies from the following 13 countries: Kazakhstan, Russia, China, Turkey, the Netherlands, France, the UAE, Bulgaria, Italy, Germany, Malaysia, Singapore, and Spain. Table 7 below summarizes the results, including the total capacity selected and prices obtained.

		WPP	SPP	HPP	BioPP	TOTAL
Projects selected (MW)	2018	500.85	270	82.08	5	857.93
	2019	108.99	86.5	7	10.4	212.89
	2020	64.95	60	23	-	147.95
	2021	50	20	11.8	5.15	86.95
	2022	400	40	-	-	440
	Total	1 124.79	476.5	123.88	20.55	1 745.72
Starting auction ceiling price (KZT/kWh)	2018	22.68/ 6.58	34.61/10.04	16.71/4.85	32.23/9.35	-
	2019	22.66/5.92	29.00/7.58	15.48/4.04	32.15/8.4	-
	2020	21.69/5.25	16.97/4.11	15.48/3.75	32.15/7.79	-
	2021	21.53/5.05	16.96/3.98	15.20/3.57	32.15/7.55	-
	2022	21.53/4.68	16.96/3.68	15.20/3.3	32.15/6.98	-
	Minimum auction price (KZT/kWh)	2018	17.39/5.04	18.00/5.22	12.80/3.71	32.15/9.33
2019	19.27/5.03	12.49/3.26	15.43/4.03	32.13/8.39	-	
2020	15.90/3.85	14.58/3.53	13.48/3.26	-	-	
2021	14.08/3.3	12.87/3.02	15.00/3.52	32,14/7.54	-	
2022	12.39/2.69	16.95/3.68	-	-	-	

The analysis of the prices proposed during the 2018-2022 auctions for wind and solar power generation shows a significant reduction. With the price for SPP projects at 34.61 KZT/kWh before RE auctions, the minimum price obtained because of the 2018-2022 auctions is equal to 12.49 KZT/kWh. Therefore, the maximum price

reduction for solar generation as a result of the RE auctions was about 66 percent. The biggest price drop occurred in the first two years of auctions. The graph below illustrates the price reduction dynamics separately for the large and small SPP projects. Both demonstrate significant price reduction (Fig. 20).

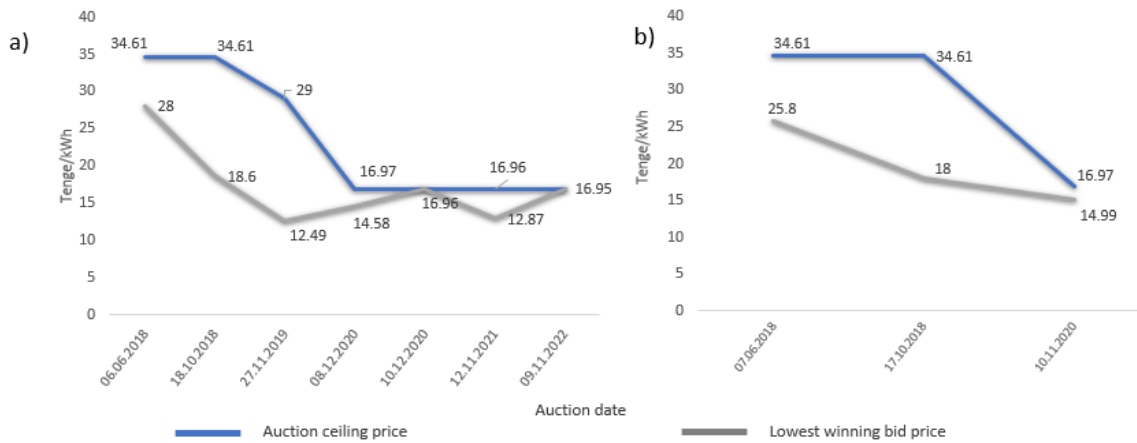

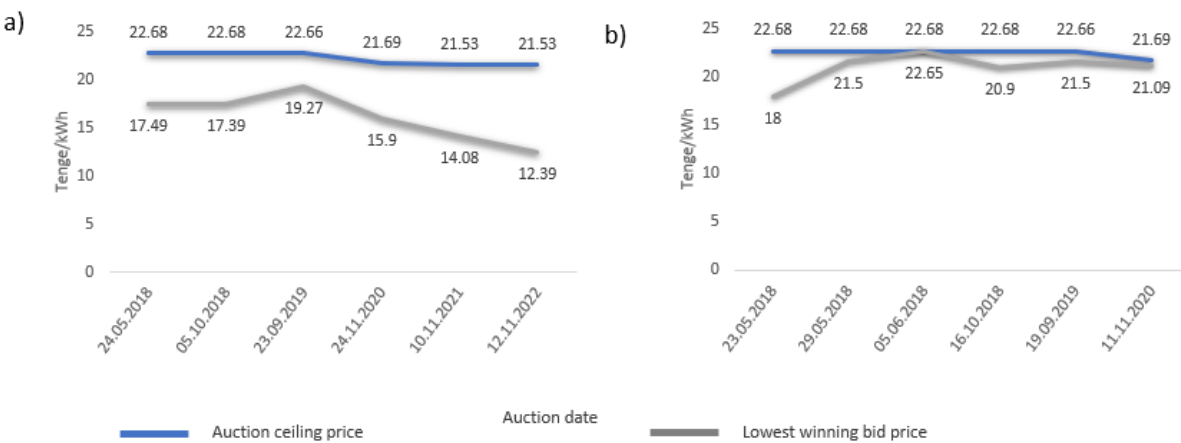

Figure 20. Dynamics of price reduction for a) large (over 10 MW) and b) small (0.1-10 MW), 2018-2022 SPP Auctions.

As for the WPP projects, the pre-auctions price was at 22.68 KZT/kWh and the minimum price obtained as a result of the 2018-2022 auctions is 12.39 KZT/kWh.

Thus, the maximum price reduction for wind generation as a result of the RE auctions was about **45** percent. The graph below illustrates the price reduction

dynamics separately for the large and small WPP projects. Although large WPP projects demonstrate a significant price reduction, small WPP projects in contrast demonstrate the increase in winning bid prices over the years of the auctions (Fig. 21).

In Central Asia, Kazakhstan has the highest share of inexpensive coal generation facilities and is the first country in the region that is actively developing RE and introducing auctions to select RE projects. The successful 2018-2022 auction results show the effectiveness and timeliness of transitioning from feed-in tariffs to an auction

mechanism, which is conducted according to international best practice.

The introduction of the auction mechanism has created competitive conditions, attracted international RE investments, reduced the costs of RE generation, and partly reduced the financial burden upon end-user consumers. At the same

time, further development of the RE sector requires continued improvement of investment conditions and the resolution of issues related to integration of increased volume of RE into the UES RK. In this regard, the Government of Kazakhstan is working to further reform regulations concerning RE investments including provisions to ensure the financial stability of the

FSC, PPA terms and conditions, integration of RE into the UES RK. Additionally, Kazakhstan is supporting national manufacturers of RE equipment and providing incentives and financial instruments to develop small-scale RE generation.
